

Neon Alley Quest: Venue/Booking Manager MVP

1) Goal and vibe

Build a fun, lightweight local-music strategy game that doubles as promo for The Hulk Caesar Show.

Player fantasy:

- You are a St. John's promoter trying to become the biggest name in town.
- You grow from small weeknight bookings into sold-out headline events.
- You win by balancing money, scene credibility, and audience hype.

Promo objective:

- Showcase real musical guests from the show as playable bands.
 - Encourage players to discover guests and episodes through in-game results and rewards.
-

2) Core gameplay loop

One run is a "season" (4 in-game weeks).

Per in-game day:

1. Choose a venue for tonight.
2. Book 1 to 3 bands.
3. Spend on promotion.
4. Resolve the night (attendance, profit/loss, fame, scene cred).
5. Handle one random scene event.

End of week:

- Venue ranking update.
- Optional "Feature Night" challenge based on that week's show theme.

End of season win condition:

- Hit fame target and successfully run one Headline Slot event.
-

3) MVP systems

A) Bands

Each band has:

- Stage name
- Genre
- Draw (how many people they can bring)
- Fee (booking cost)
- Reliability (chance they perform well)
- Crowd energy (affects hype/fame)
- Show-link metadata (episode URL, clip URL)

B) Venues

Each venue has:

- Name
- Capacity
- Base rent
- Genre affinity map
- Prestige level
- Risk factor (tech issues/noise complaints)

C) Promotion

Simple promo packages:

- Posters
- Social boost
- Radio shoutout
- Street team

Each package increases attendance chance differently and costs budget.

D) Scene events

Examples:

- Gear failure: attendance or energy penalty
- Surprise influencer: attendance bonus
- Weather warning: turnout penalty
- Guest interview buzz: fame bonus if booking featured artist

E) Stats

Player stat model (MVP):

- Money
- Fame
- SceneCred
- FanTrust
- CurrentWeek
- DayInWeek

4) Suggested balancing (MVP defaults)

Starting state

- Money: 300
- Fame: 0
- SceneCred: 0
- FanTrust: 50

Band stat ranges

- Draw: 20 to 120
- Fee: 20 to 180
- Reliability: 55 to 95
- CrowdEnergy: 40 to 100

Venue stat ranges

- Capacity: 60 to 500
- BaseRent: 30 to 220
- Prestige: 1 to 5

Promo costs and effects

- Posters: cost 10, attendance multiplier +0.06
- Social boost: cost 20, attendance multiplier +0.12
- Radio shoutout: cost 35, attendance multiplier +0.18
- Street team: cost 50, attendance multiplier +0.24

Economy defaults

- Avg ticket price baseline: 12
- Venue concession share to player: 2 per attendee when sold above 75% capacity

5) Night resolution formula (simple and transparent)

Use easy-to-tune components:

- bandDraw = sum of booked bands' draw
- fitBonus = average genre fit between booked bands and venue
- promoBonus = sum of promo package multipliers
- reliabilityFactor = average reliability of booked bands
- noise = random between 0.88 and 1.12

$\text{attendancePotential} = (\text{bandDraw} * (1 + \text{fitBonus} + \text{promoBonus})) * (\text{reliabilityFactor} / 100)$

$\text{attendanceRaw} = \text{attendancePotential} * \text{noise}$

$\text{attendance} = \text{clamp}(\text{round}(\text{attendanceRaw}), 0, \text{venue.capacity})$

$\text{revenue} = \text{attendance} * \text{ticketPrice}$

$\text{costs} = \text{venue.baseRent} + \text{sum}(\text{band.fee}) + \text{promoSpend}$

$\text{profit} = \text{revenue} - \text{costs}$

fameDelta:

- +2 if attendance >= 60% capacity
- +5 if attendance >= 90% capacity
- +venue.prestige if sold out
- -2 if attendance <= 35% capacity

sceneCredDelta:

- +1 for each booked local guest artist
- +2 if genre fit >= 0.25
- -1 if no-show event triggers

fanTrustDelta:

- +2 for profitable night
- -3 for large loss (profit < -80)

6) Progression and win condition

Progression tiers by Fame:

- 0 to 19: Back Alley Booker
- 20 to 49: Downtown Promoter
- 50 to 89: Scene Staple
- 90+: Headline Power

Headline Slot unlock:

- Fame $\geq$ 90
- SceneCred $\geq$ 25
- FanTrust $\geq$ 55

Final win check:

- Successfully run a Headline Slot night (attendance $\geq$ 85% and profit $\geq$ 0)
-

7) UI flow (MVP)

Screen 1: Game Hub

- Start/continue season
- Current stats summary
- This week's featured guest card

Screen 2: Day Planner

- Venue picker
- Band picker (up to 3)
- Promo picker
- Projected estimate card (attendance/profit risk)

Screen 3: Night Result

- Attendance meter
- Profit/loss summary
- Fame/SceneCred/FanTrust changes
- Event card outcome line
- Optional "Watch this guest" CTA

Screen 4: Week Summary

- 5-day recap table
- Best night highlight
- Suggested strategy for next week

Screen 5: Season Finale / Headline Attempt

- Special high-capacity venue event
 - Win/loss badge and shareable recap text
-

8) Content model tied to local bands and venues

Minimum MVP content

- 10 to 16 bands (mostly from show guests)
- 5 venues (small, medium, big, prestige, wildcard)

- 8 random scene events
- 4 weekly featured-guest challenges

Venue examples (placeholder names)

- Alley Room (small)
 - Harbour Hall (medium)
 - Downtown Electric (mid/high)
 - Quidi Stage (high prestige)
 - Signal Dome (headline-only)
-

9) Promo hooks for The Hulk Caesar Show

- "Featured guest this week" provides booking bonus if used.
- After a successful show with featured guest: show watch link to episode clip.
- Weekly challenge copy can mirror current show releases.
- End-of-season share message includes guest names and venue highlights.

Example recap text: "I sold out Harbour Hall with [Guest Artist] and hit Headline Power in Neon Alley Quest."

10) Recommended admin tooling (extends current work)

Use /admin/game as the design center with extra sections:

1. Theme
 - City name
 - Flavor copy
 2. Bands
 - Add/edit guest artists
 - Set draw, fee, reliability, crowd energy, genre
 - Set episode/clip link
 3. Venues
 - Capacity, rent, prestige
 - Genre affinity weights
 4. Events
 - Event description
 - Trigger chance
 - Effects (attendance, fame, cred, trust)
 5. Weekly features
 - Pick featured guests for promo bonuses
-

11) Data model draft (TypeScript)

```
export type GameBand = {  
  id: string;  
  stageName: string;  
  genre: string;  
  draw: number;
```

```

    fee: number;
    reliability: number;
    crowdEnergy: number;
    episodeUrl?: string | null;
    enabled: boolean;
};

export type GameVenue = {
    id: string;
    name: string;
    capacity: number;
    baseRent: number;
    prestige: number;
    genreAffinity: Record<string, number>; // -0.2 to +0.3
    enabled: boolean;
};

export type PromoPackage = {
    id: string;
    label: string;
    cost: number;
    attendanceBoost: number;
};

export type SceneEvent = {
    id: string;
    label: string;
    chance: number; // 0..1
    attendanceDelta?: number;
    fameDelta?: number;
    sceneCredDelta?: number;
    fanTrustDelta?: number;
};

export type BookingState = {
    money: number;
    fame: number;
    sceneCred: number;
    fanTrust: number;
    currentWeek: number;
    dayInWeek: number;
};

```

12) How this maps to current codebase

Current status:

- Existing game action loop already supports one-turn actions and persisted player state.
- Existing /admin/game editor already supports rival-oriented design data and save/load API.

Migration path:

1. Expand game-design config to include bands, venues, promo packages, events.
 2. Replace current "fight" action with "run_show" action.
 3. Add action endpoints for setup flow:
 - choose_venue
 - book_band
 - set_promo
 - run_show
 4. Keep daily turn reset system as-is (fits game loop).
 5. Keep all auth/admin patterns from existing admin routes.
-

13) MVP acceptance criteria

- Player can finish a full 4-week season.
 - At least 10 local/guest bands are selectable.
 - Venue choice, booking, and promo all materially affect attendance.
 - End-of-night result clearly explains why player won/lost money and fame.
 - Featured guest tie-in appears at least once per week.
 - Headline slot can be unlocked and completed.
-

14) Post-MVP ideas

- Rival promoter AI each week
- Genre trend shifts by week
- Venue upgrades
- Co-op mode: two promoters compete on scoreboard
- Show-integrated monthly leaderboard
